Armezon® Herbicide For Broadleaf and Grass Control in Sugarcane

Benefits of Armezon Herbicide

Unique Chemistry
- Cross-spectrum control of tough grasses and broadleaf weeds
- Superior performance on bermudagrass
- For rescue control or suppression of large (more than 12 inches tall) annual grasses

Flexible
- Wide window of application
- Low use rate for operational efficiency
- Mixes well with other tank mix partners
- No insecticide use restrictions
- Applications on plant cane or sugarcane grown from stubble (ratoon)

As an effective cross-spectrum tank-mix partner, Armezon herbicide is tough on broadleaf weeds and grasses to protect yield potential for sugarcane.
Best Use Recommendations

Application Timing
Applications can start during the fallow period before sugarcane is planted (0 month rotational interval to sugarcane) through postmergence and must be completed 100 days before harvest.

Use Rates
- Apply Armezon herbicide at 1-2 fl oz/A with MSO or COC spray adjuvant (1-1.5% v/v) plus nitrogen fertilizer (AMS, 8.5-17 lbs per 100 gallons or UAN 1.25-2.5% v/v).
- Do not apply more than 2 fl oz/A Armezon herbicide per application
- Do not apply more than 4 fl oz/A Armezon herbicide per year
- For labeled annual grasses greater than 12 inches tall (Fall panicum and others) apply Armezon herbicide at 2 fl oz/A.
- Armezon herbicide can be tank mixed with other sugarcane herbicides for residual weed control
- Note rotational restrictions if applying Armezon herbicide in the last year of a ratoon crop

Bermudagrass
- Apply 1 to 2 fl oz/A of Armezon herbicide in plant cane when bermudagrass runners are 3 to 4 inches. Tank mix other herbicides to enhance bermudagrass activity and for broad spectrum weed control. In ratoon cane, apply Armezon herbicide early in the season at the onset of bermudagrass greenup or emergence of new leaves.
- Multiple sequential applications at 2 to 3 week intervals may be necessary for best control (for example, 2 oz followed by 2 oz, or 2 oz followed by 1 oz followed by 1 oz)
