Benefits of Prowl® H20 Herbicide

- Controls over 50 important grass and broadleaf weeds
- Provides residual control of both glyphosate and HPPD resistant waterhemp and palmer amaranth
- Water-based encapsulation easily washes off residue to control germinating weeds
- Low water solubility makes Prowl H20 ideal for residual weed control under irrigation and on coarse soils

Prowl H20 combines a unique site-of-action for weed control with the flexibility of Preemerge or Postemerge application

Prowl H20 Use Rates for Preemergent and Postemergent Applications to Corn

Prowl H20® may be used either Preemergence or Postemergence in corn to control weeds as they germinate and before they emerge from the soil.

Best Use Recommendations

**Preemergence**
- Apply after planting but before weeds and crop emerge
- Planting depth must be at least 1.5" deep and seed must be completely covered with soil
- Tank-mix with Sharpen® herbicide for enhanced burndown and residual broadleaf control. See Sharpen label for details.

**Postemergence**
- Apply Prowl H20 from spike to V8 or 30" tall corn, whichever is more restrictive
- Tank mix with Status® or Armezon™ herbicides for control of emerged weeds. See Status and Armezon labels for details

Prowl H20 Tank Mixing Instructions

- Fill tank 1/2 to 3/4 full with clean water and agitate
- If tank mixing glyphosate, add ammonium sulfate and agitate
- Wettable Powder (WP) Formulations—make slurry in water and add slowly into the partially filled tank while agitating
- Dry Flowable (DF) / Water Dispersable Granule (WDG) formulations
- Flowable (F) formulations
- Add Prowl H20 to partially filled tank while agitating
- Water Soluble Concentrate (SC) formulations
- Emulsifiable Concentrate formulations, including non-ionic surfactants and oil-based adjuvants

Always read and follow label directions.
