

Provysol[™] Fungicide on Sugarbeets

A New Standard for Residual Control

Provysol fungicide was engineered to set a new standard for residual control with curative activity against tough-to-fight diseases like Cercospora Leaf Spot. Growers who use Provysol fungicide will benefit from improved performance over their current treatments, even on pathogens that have developed insensitivity to older chemistries.

Benefits of Incorporating Provysol Fungicide into Your Sugarbeet Fungicide Program

- Excellent CLS control performance, allowing you to reach your yield and recoverable sugar goals
- Powerful early-season activity, relieving some of the workload from subsequent fungicide applications
- Excellent tank-mix and rotation compatibility

Internal BASF Small-Plot Research Trial, ND (2019). Comparing disease

efficacy of individual DMI fungicides. Provysol fungicide program: Provysol fungicide + Manzate[®] Max fungicide. Photo taken 11 days after last application.

Provysol fungicide was introduced in 2019 under a Section 18 Emergency Registration for the control of Cercospora Leaf Spot (CLS). It is now widely available for U.S. sugarbeet growers in need of a newer, more effective tool for managing CLS.
